

For Operating Day: Thursday, May 24, 2018

The Renewables Watch provides important information about actual renewable production within the ISO grid as California moves toward a 33 percent renewable generation portfolio. The information provided is as accurate as can be delivered in a daily format. It is unverified raw data and is not intended to be used as the basis for operational or financial decisions.

Renewables Production

24-Hour Renewables Production

Renewable Resources	Peak Production Time	Peak Production (MW)	Daily Production (MWh)
Solar Thermal	12:08	458	4,598
Solar	13:03	10,045	100,048
Wind	21:32	3,145	53,922
Small Hydro	18:35	601	11,475
Biogas	19:02	246	5,723
Biomass	18:24	336	7,509
Geothermal	23:47	1,002	23,158
Total Renewables			206,433

Total 24-Hour System Demand (MWh): 597,755

This table gives numeric values related to the production from the various types of renewable resources for the reporting day. All values are hourly average unless otherwise stated. Peak Production is an average over one minute. The total renewable production in megawatt-hours is compared to the total energy demand for the ISO system for the day.

Hourly Average Breakdown of Renewable Resources

This graph shows the production of various types of renewable generation across the day.

System Peak Demand (MW)
*one minute average 28,175
Time: 20:32

Hourly Average Breakdown of Total Production By Resource Type

This graph depicts the production of various generating resources across the day.

Previous Renewables Watch reports and data are available at <http://www.aiso.com/green/renewableswatch.html>

This table gives numeric values related to the production from the various types of renewable resources for the reporting day. All values are hourly average unless otherwise stated. Peak Production is an average over one minute. The total renewable production in megawatt-hours is compared to the total energy demand for the ISO system for the day. Solar PV and Solar thermal generators that are directly connected to the power grid. "Solar PV" is defined as solar generating units that utilize solar panels containing a photovoltaic material. "Solar Thermal" is defined as solar generating units that convert sunlight into heat and utilize fossil fuel or storage for production which may occur after sunset.

For Operating Day:

The first graph provided on this page shows how much energy renewable resources are contributing to the grid, and when those resources are producing their daily maximum and how that production correlates to the maximum energy demand.

Comparison to Load

The information contained in this report is preliminary and subject to change without notice. No inference, decision or conclusion should be made based on the information in this report or any series of these reports. All values are hourly average unless otherwise stated. Questions about this report should be directed to the ISO Service Desk at 916-351-2309 or 888-889-0450.
